project 1 demonstrates generating a dsa digital signature algorithm key pair using the cryptography library where a 2048 bit private key is created and a corresponding public key is derived the private key is essential for securely signing digital messages and the public key allows others to verify these signatures both keys are serialized into pem format making them suitable for storage or transmission the private key is serialized without encryption though encryption is optional while the public key is also serialized for easy sharing and use in cryptographic operations project 2 is a dsa digital signature algorithm key generator application built with python s tkinter for the gui and the cryptography library for key generation it provides an intuitive interface to generate view and save 2048 bit dsa key pairs essential for secure digital signatures the gui features two tabs generate keys for creating and serializing keys into pem format and view keys for displaying them users can save the keys as pem files with ease supported by robust error handling and success notifications making the application accessible and practical for secure communication needs project 3 demonstrates the process of signing and verifying a message using the digital signature algorithm dsa in python while ensuring the signature is utf 8 safe by encoding it in base64 it begins by generating a dsa private and public key pair with a key size of 2048 bits a message in bytes is then created which is the data to be signed the private key is used to generate a digital signature for the message using the sha 256 hashing algorithm ensuring the integrity and authenticity of the message the generated signature which is binary data is encoded into base64 format to make it text safe and suitable for utf 8 encoding to verify the signature the base64 encoded signature is first decoded back into its original binary form the public key is then used to verify the authenticity of the signature by comparing it to the message if the verification is successful the message signature is valid is printed otherwise an InvalidSignature exception is raised and the message signature is invalid is displayed this approach ensures that the digital signature can be safely transmitted or stored as text without data corruption while still preserving its security properties project 4 is a tkinter based gui application for digital signature algorithm dsa operations offering an intuitive interface for generating

dsa keys signing messages and verifying signatures it has two main tabs one for generating and displaying dsa key pairs in pem format and another for signing and verifying messages users can input a message sign it with the private key and view the base64 encoded signature or verify a signature against the original message using the public key the application handles errors gracefully providing feedback on operations making it a practical tool for cryptographic tasks project 5 and 6 provides a complete implementation for generating signing and verifying files using the digital signature algorithm dsa it includes functions for creating dsa key pairs signing file contents and verifying signatures the generate and save keys function generates a private and public key serializes them to pem format and saves them to files the sign file function uses the private key to sign the sha 256 hash of a file s content saving the signature in base64 format the verify file signature function then verifies this signature using the public key ensuring the file s authenticity and integrity the project is designed as a user friendly tkinter based gui application with three main functionalities key generation file signing and signature verification users can generate dsa key pairs in the generate keys tab sign files in the sign file tab and verify signatures in the verify signature tab by providing an intuitive interface this application enables users to efficiently manage cryptographic operations ensuring data security and authenticity without needing to understand low level cryptographic details project 7 and 8 focuses on creating and securing synthetic financial datasets to ensure data integrity it combines data generation digital signing and signature verification to authenticate and protect financial records the primary goals are to generate realistic financial data secure it with digital signatures and verify these signatures to detect tampering or corruption the project involves generating a synthetic dataset with multiple columns such as transaction ids account numbers amounts currencies timestamps and transaction types dsa keys are then generated for signing and verification with the private key used for signing each entry in the dataset these signatures are saved separately allowing verification using the public key this process ensures that any unauthorized changes to the data are detected demonstrating a secure approach to data handling in financial applications project 9 and 10 combines the digital signature algorithm dsa with least significant bit lsb steganography to securely hide a signed message within an image first dsa keys are generated and used to sign a message ensuring its authenticity and integrity the signed message is then embedded into an image using lsb steganography where the least significant bits of the image pixels red channel are altered to include the binary representation of the message and its signature to extract and verify the hidden data the code retrieves the embedded bits from the image and reconstructs the original message it then uses the public dsa key to verify the signature confirming the message s authenticity this integration of cryptographic signing

with steganography provides a secure method to conceal and authenticate sensitive information within an image file project 11 and 12 provides a workflow for encrypting and hiding data using rsa and dsa cryptographic algorithms along with steganography it begins with generating rsa and dsa keys then encrypts a message using rsa and signs it with a dsa private key ensuring confidentiality and authenticity the encrypted and signed data is embedded into an image using least significant bit lsb steganography altering the pixel values to include the hidden information the process continues by extracting the hidden data from the image verifying its integrity using the dsa signature and decrypting the message with the rsa private key this approach demonstrates a secure method of combining encryption digital signatures and steganography to protect and authenticate sensitive data making it a robust solution for secure data transmission
